

# TUBE WORKS OPERATION MANUAL

# 6025

# TUBE DRIVER PRACTICE COMBO

## FEATURES

12AX7A TUBE DRIVER®  
Preamp 25 Watt MosValve™ Amplifier section  
Classic Voiced 10" speaker  
3 band EQ section  
Accutronics® Reverb  
Headphone Jack  
Dual Voltage switch

## OPERATION

The 6025 has been designed as a unique high quality practice amp with enough power and tone for small performance venues. The tube preamp section and the 25 watt MosValve™ amp section combine to provide anything from a smooth, warm "clean" sound, all the way to a huge "super-overdrive" crunch.

**TUBE DRIVE**—This control provides the pre-gain to the 12AX7A tube. Use this control with the Master control to dial in all desired sounds. For a good clean sound this control should be set at the 3 or 4 position. As this control is increased, tube over-drive increases. *NOTE: At the 8 to 10 position the tube is driven into a @Super-Overdrive" stage for extreme distortion.*

**MASTER**—This control provides the Master volume for the Preamp stage. Use this control in conjunction with the Tube Drive control for sounds from "Clean" to "Super Over-Drive".

**EQUALIZATION**—3 bands of passive EQ are provided for tone shaping.

**REVERB**—This control sets the amount of signal sent to the Accutronics® Reverb unit. Increased Tube Drive level will increase the Reverb level.

**HEADPHONE JACK**—Use this output for your headphones when silent practicing is desired. The 10" speaker is turned off when headphones are inserted.

**POWER INLET RECEPTACLE**—The 6025 features a dual voltage transformer for either 115V or 230V operation. *IN THE USA, ALWAYS USE THE 3 PRONG DETACHABLE CORD SUPPLIED, AND THE VOLTAGE SWITCH MUST BE IN THE 115V POSITION.*

**EXPOSURE**—Common sense (as well as the law) dictates that you do not operate the unit where it will be exposed to moisture or rain, excessive ambient heat (over 110 degrees F / 40 degrees C) or without a properly grounded A.C. power connector.
